

CONFIDENTIAL · ACQUISITION PROSPECTUS

NeuralQuant

AI Stock-Intelligence Platform

Live · Production-Deployed · Investor-Demo-Ready

PREPARED

June 2026

SELLER

Satyam Das — satyamdass03@gmail.com

ASSET

NeuralQuant (neuralquant.co)

STATUS

Live, production-deployed, v4.1.0

STRICTLY CONFIDENTIAL — TRANSMIT ONLY AFTER A SIGNED MUTUAL NDA. This document and every demonstration, figure, and metric it contains are disclosed in confidence under a non-disclosure agreement. It is not for public circulation, posting, forwarding, or distribution without a signed NDA in place.

1. Executive Summary

NeuralQuant delivers what no competitor currently offers at a retail price point: institutional-grade quantitative factor analysis combined with an adversarial multi-agent AI research committee and voice-native interfaces — covering both Indian (NSE/BSE) and US (NYSE/NASDAQ) equity markets in a single production-deployed platform.

Proprietary internals — source code, agent prompts, factor weights, the IRS% composite formula, the regime-transition logic, and credentials — are disclosed only under a signed NDA during due diligence. This document conveys scope and value, not the recipe. Nothing in this prospectus is an enabling technical disclosure of the patent-pending methods.

DISCLOSURE STATUS — A provisional patent application covering the platform's core inventive methods is in active preparation with Indian patent counsel; filing is targeted within weeks. Until that filing is complete, this prospectus is shared strictly under a signed mutual NDA and contains no enabling implementation detail. All proprietary internals are reserved for NDA-gated due diligence.

What you are buying	A complete, running business-in-a-box: domain, brand, codebase, 7-service infrastructure, data pipeline, a provisional patent in active preparation, the PARA-DEBATE methodology, backtest track record, and operations documentation. Live. Generating outputs. Ready for Day-1 operation by the acquirer.
Why it exists	Built by a solo founder (Master of AI, UTS Sydney) to solve a real gap: no platform gave retail investors institutional-grade multi-factor quantitative research — and none covered India + US in a single AI-native framework.
Why it is being sold	The seller is mid-programme in a Master of AI at the University of Technology Sydney. The platform deserves a full-time commercial team, enterprise sales, and institutional backing to reach its potential. It is being sold to a buyer who can scale it — not wound down.
Why now	A structured sale is underway and multiple parties have been approached; the seller reserves the right to accept an LOI at any time. The AI-equity-research category is beginning to attract entrants, and the India + US dual-market position is currently uncontested. Early acquisition locks in that dual-market moat — and the patent priority date — before the category becomes crowded.

2. The Competitive Moat — Why NeuralQuant Wins

No existing retail-accessible product combines all four of NeuralQuant's pillars simultaneously: (1) multi-factor quantitative scoring, (2) an adversarial multi-agent AI committee, (3) India + US dual-market native coverage, and (4) voice-native interfaces.

Platform	Price / mo	Multi-agent AI	Adversarial debate	India (NSE-native)	Voice agents	Live-data quant scoring
Bloomberg Terminal	\$2,000	X	X	X	X	Data only

Danelfin	~\$34	Scoring only	X	X(US only)	X	✓(US only)
Ticker.in	~\$5	X	X	✓(India only)	X	Basic
ChatGPT / Claude	\$20	General	X	X	General voice	X(no live data)
NeuralQuant	\$9.99	✓	✓	✓	✓(2 live)	✓(US + India)

Bloomberg has the data but no AI reasoning layer and a 200x higher price. Danelfin has scoring but is US-only, single-score, no adversarial scrutiny, no voice. Ticker.in covers India but has no AI engine. General-purpose LLMs have no live market data and no quant engine — they hallucinate numbers. NeuralQuant is the only product that combines all four pillars, at a retail price point.

And building it yourself? The Engineering Investment section quantifies it: 24–37 senior engineer-months plus 6–12 months of calendar, the data-source and voice-stack integration scars a live system has already absorbed, and a pending patent that raises a copier's cost and legal risk. Acquisition collapses that timeline to zero.

3. What Is Being Acquired

A complete, running business-in-a-box: domain, brand, codebase, infrastructure, data pipeline, intellectual property, and operating services.

Surface area at a glance

Dimension	Scale
Backend API routers	33
Web pages / routes	38
Running services	7 (4 Render, 1 Vercel, 1 Railway, 1 Supabase)
Scheduled jobs	4 daily cron jobs
Production tests	116+ (passing)
Markets covered	US + India
Stock universe	~949 stocks (502 India + 447 US)
AI agents	8 distinct agents (research, debate, voice)
Live voice interfaces	2 (voice PM + ambient companion)
Patent	Provisional application in preparation (patentability search underway; filing imminent)
Current version	v4.1.0
Day 1 for the acquirer	Platform runs autonomously — 4 cron jobs execute, 13/13 smoke suite passes, all 7 services live. Take ownership and it keeps running with zero immediate intervention.

4. Flagship Capabilities — All Live

Every capability below is live in production at neuralquant.co today — demonstrable in a 45-minute live walkthrough. ★marks the three patent-pending IP differentiators.

Capability	What it does
Adversarial research committee ★	Multi-agent LLM investment committee producing a bull case, a steelmanned adversarial bear case (Devil's Advocate agent), and a synthesised verdict per stock. Designed to prevent consensus herding — the structural failure of single-model AI analysis. No competitor currently ships an adversarial debate architecture.
IRS% quantitative scoring engine ★	Proprietary Investment-Readiness Score (IRS%) combining 5 academic factors: Piotroski F-Score (quality), Jegadeesh-Titman momentum, HMM regime-adaptive weighting, a value composite, and a low-volatility factor. India equities add NSE Bhavcopy delivery_pct as a sixth liquidity-conviction signal — unique to Indian market microstructure, not offered by any comparable platform.
HMM regime detection ★	Hidden Markov Model classifying market state into 4 regimes (Risk-On / Risk-Off / Bear / Late-Cycle). Factor weights dynamically reweight by detected regime — Bear weights quality and value; Risk-On weights momentum. No retail AI research platform offers regime-adaptive quantitative scoring.
Voice portfolio manager	Real-time conversational voice agent (LiveKit WebRTC + Deepgram STT + reasoning LLM + ElevenLabs TTS). ~20 function-calling tools, file upload, and a whiteboard. Full portfolio-discussion capability.
Ambient voice companion	Always-listening voice assistant with page-context awareness, a wake word, and a morning market briefing. Voice-native equity research is ahead of the market — competitors are text-only.
Written research analyst	Queryable AI analyst returning cited, data-validated written research on demand. Live price injection, clarification questions, and numeric-hallucination suppression via per-agent reconciliation against a [VERIFIED] data layer.
Live paper-trading dashboard	Real-time trading matrix with equity curve, trade tape, and a strategy-reflection SSE stream. Dry-run operational; ready for live-trading activation.
Methodology & backtest page	Public methodology page with legally-cautious disclosure. Backtest baseline stored in Supabase for full reproducibility — 87–91% hit rate, +12.69 to +14.83% alpha vs NIFTY50 (Q1 FY27).

5. System Architecture (Overview)

How the platform fits together, end to end — without exposing the proprietary core. Data flows top to bottom. The two engines shown in gold are sealed: their internals (factor weights, HMM regime-transition matrix, agent prompts, and the IRS% composite formula) are disclosed only under NDA during due diligence. The quant engine and the AI committee cross-feed: quantitative scores frame the agents' debate, and the committee's verdict is reconciled against the [VERIFIED] data layer.

What is deliberately not shown: per-regime factor weights, HMM transition probabilities, the IRS% composite formula, and the PARA-DEBATE™ agent prompts. These are the asset's trade secrets — conveyed only under NDA. The diagram lets a buyer understand how value is produced without enabling replication.

6. Strategic Fit by Buyer Type

NeuralQuant is not a one-size-fits-all asset — its value is highest to four distinct buyer profiles, each acquiring a different strategic advantage.

Buyer type	What they acquire	Why it matters
Indian brokers	Ready-made AI research layer for 90M+ Demat holders — no build required	Differentiated retention feature deployable on day one vs an 18-month internal build
US / global fintechs	India market entry (NSE + BSE with India-specific signals)	The dual-market pipeline would take ~18 months to build independently; here it is already live
PE firms / family offices	Proven backtested alpha (+12.69% to +14.83% vs NIFTY50, Q1 FY27), with patent protection in preparation	A defensible, IP-encumbered asset to acquire and scale with a commercial team
AI companies	Voice-native equity research — 2 live voice agents already deployed	Voice-first financial research is ahead of the market; competitors are text-only

7. Technology Stack

Layer	Technology
Backend	FastAPI, Python 3.12, async
Frontend	Next.js 16, React 19, Tailwind v4 (PWA)
Database / Auth	Supabase (Postgres + cookie-session auth)
Voice real-time	LiveKit Cloud (WebRTC SFU)
Speech-to-text	Deepgram
Text-to-speech	ElevenLabs (neural voices)
LLM providers	Anthropic (Claude) + AWS Bedrock (cross-region)
Market data	FMP Premium, Finnhub, yfinance, OpenBB, EDGAR, FRED
Hosting	Render (4), Vercel (web), Railway (trading), Supabase (DB)
CI/CD	GitHub Actions, Render + Vercel auto-deploy
Repository	Monorepo, uv workspace

8. Infrastructure (Operating Today)

All services are running and verified as of the date of this document.

Service	Role	State
Core API	33-router FastAPI backend	Live
Voice agent worker	LiveKit voice agents (2)	Live
Paper-trading worker	Trading daemon	Live (dry-run)
Market-data proxy	OpenBB platform (live-price unlock)	Live
Trading engine	Crypto paper trading + SSE stream	Live
Web app	neuralquant.co, 38 pages	Live
Database	Postgres + auth	Live

Scheduled jobs: 4 daily cron jobs handling nightly scoring, market refresh, and per-market end-of-day wrap reports.

Security hardening: the platform has undergone a multi-phase security pass including log redaction, secret-scanning in CI, row-level security policies, IDOR remediation, content-security-policy headers, rate-limiting fuses, upload guards, dependency auditing, and an audit-event log with an incident-response runbook.

9. Validation & Track Record

Backtest results (Q1 FY27, India)

Metric	Result
Benchmark	NIFTY50 (−6.38% over the period)
Model pools vs benchmark	All three pools beat NIFTY50
Alpha (outperformance)	+12.69% to +14.83%
Hit rate	87–91%
Reproducibility	Baseline stored in Supabase

Automated smoke testing

A 13-endpoint live smoke suite runs against production and currently passes 13/13, covering core pages, stock detail (US + India), screener, portfolio, trading dashboard, news, methodology, and pricing.

Intellectual property & patent moat

The platform benefits from a developing IP moat. A provisional patent application is in active preparation with Indian patent counsel (Intepat IP Services), with a patentability search underway and filing targeted within weeks. On filing, the provisional will secure an early priority date covering the core inventive elements below:

- The PARA-DEBATE adversarial multi-agent debate architecture (a structured “Devil's Advocate” agent that steelmans the bear case before synthesis).
- The HMM-based regime-adaptive factor-weighting engine (factor weights shift dynamically across Risk-On / Risk-Off / Bear / Late-Cycle market states).
- The NSE delivery_pct India-specific liquidity conviction signal — a market-microstructure factor not present in any comparable system.

On filing, this establishes patent-pending status in India, with a PCT filing contemplated within the 12-month priority window to extend protection across 150+ jurisdictions. In parallel, the PARA-DEBATE trademark is being prepared for registration in India under Class 42. Backend trade secrets — per-regime factor weights, HMM transition probabilities, agent-prompt architecture, and the IRS% composite formula — sit alongside the patent as a second, non-public layer of protection. The lead independent claim is anchored on the numeric-reconciliation system and the integrated architecture, with the regime engine, the India delivery-signal factor, and the adversarial committee as supporting features.

Regulatory posture

Methodology and high-level backtest results are published on a public methodology page in a legally-cautious manner (no guaranteed-return claims). SEBI-compliance considerations for India have been researched. Note: pending the provisional filing, no further implementation detail will be added to any public surface; all additional technical depth is reserved for NDA-gated diligence.

10. Engineering Investment (Cost Breakdown)

The asking price is grounded in what it would cost an acquirer to recreate an equivalent system from scratch — in money, time, and risk. The figures below are rebuild-cost estimates based on senior-engineer effort per subsystem, in person-months. They describe scope, not proprietary internals.

Subsystem rebuild effort

Subsystem	Scope (no IP detail)	Senior eng-months
Backend API	33 async routers, auth, quota, rate limit, sessions	4–6
Multi-agent research engine	Adversarial committee, synthesis, verdict	3–4
Written research analyst	Query routing, data validation, live price	2–3
Quantitative scoring engine	Multi-factor + IRS% + regime + walk-forward	2–3
Data pipeline	6-source ingestion, US+India parity, caching	3–4
Voice agent #1 (PM)	LiveKit, ~20 tools, STT/TTS, upload, whiteboard	2–3
Voice agent #2 (companion)	Ambient, wake word, page context, briefing	1–2
Frontend web app	38 pages, PWA, voice UI, charts, auth flows	3–4
Live trading dashboard	Real-time matrix, SSE, equity curve, tape	1–2
DevOps & infra	7-service deploy, CI/CD, 4 cron, secrets, monitoring	1–2
Security hardening	RLS, IDOR, CSP, audit log, fuses, dep-audit, IR	1–2
Testing	116+ tests, live smoke, backtest harness	1–2
TOTAL	24–37 senior eng-months	

Translated to cost

At senior-engineer rates:

- **India senior** (₹2–3L/month): ₹48L–1.1Cr in pure labor.
- **US senior** (\$12–18k/month): \$290k–\$665k (₹2.4–5.6Cr).

These are labor-only figures. They exclude infrastructure spend to date, domain and brand assets, patent filing fees and legal, 6–12 months of calendar opportunity cost, and build risk (a from-scratch rebuild has material probability of schedule overrun, data-source breakage, and integration failure that a live system has already absorbed).

The “live and de-risked” premium

An acquirer purchasing a running system avoids 6–12 months of build calendar, data-source integration risk (the platform already solved multiple provider failures, rate limits, and US/India market divergences), voice-stack integration risk (LiveKit + STT + LLM + TTS pipelines are notoriously flaky to stabilize), and security debt accumulation. Conservatively, the de-risked + live + calendar-saved premium is 1.5–3x raw rebuild cost.

11. Valuation Rationale

The single firm ask of ₹3 Crore sits at the lower end of the strategic / IP value band and is supported by every approach below.

Approach	Result
Raw rebuild cost (India senior)	₹48L–1.1Cr
Raw rebuild cost (US senior)	₹2.4–5.6Cr
Rebuild + live/de-risked premium (1.5–3x)	₹1.5–3.4Cr
Strategic / IP value (IRS% + patent + voice moat)	₹3–5Cr
Revenue multiple	Not applicable (pre-revenue; see Revenue Model Projection)

Pre-revenue by design — a clean greenfield, not a gap

The platform has been deliberately kept pre-revenue, with the seller prioritising technical robustness, IP defensibility, and backtest validation over early-stage commercialisation. Payments infrastructure, including Stripe integration, is already in place and activation-ready, enabling an acquirer to capture 100% of monetisation upside from closing. With no legacy pricing obligations, no embedded churn, and no inherited customer-support burden, the asset offers a clean, greenfield revenue build on top of a production-ready, patent-pending platform.

Accordingly, valuation is anchored on asset/rebuild + IP premium, not on a revenue multiple. A revenue multiple would apply only after the acquirer monetizes — see the illustrative ROI model in the next section.

12. Revenue Model Projection (Illustrative)

The platform is pre-revenue today, but the monetisation engine is built and activation-ready. The scenarios below are illustrative, not guaranteed — they exist to give an acquirer a mental model for return on investment.

Scenario	Assumption	Indicative ARR
Conservative	2,000 paying subscribers @ \$9.99/mo	~\$240K ARR
Base	5,000 subscribers + B2B API tier	~\$800K ARR
Upside	50,000 subscribers via broker partnership	~\$6M ARR

For a strategic buyer with an existing distribution channel — a broker or wealth platform — the upside scenario makes payback effectively immediate. For a standalone buyer, the base-case ARR recovers the purchase price well inside the first year of monetisation (illustrative, gross of operating costs).

These projections are illustrative scenarios provided for buyer modelling only. They are not forecasts, guarantees, or representations of future performance.

13. Asking Price

₹3 Crore · a single, firm ask

The price is anchored on rebuild cost plus the live / de-risked premium plus strategic IP value (see Engineering Investment and Valuation Rationale), and sits at the lower end of the strategic-value band. It is a firm ask for a serious strategic acquirer — a brokerage, fund, or fintech — not an opening number in a negotiation ladder.

14. What Transfers on Acquisition

- Domain (neuralquant.co) and brand assets
- Full source code (monorepo) under NDA / LOI
- All infrastructure accounts (Render, Vercel, Supabase, Railway, LiveKit) — credentials transferred securely
- Data pipeline configurations and cached market data
- Patent application — assignment of the provisional (once filed) and all rights in the underlying invention to the acquirer
- Methodology and backtest baselines
- Operations runbooks and security documentation
- A knowledge-transfer period (suggested 2–4 weeks) to hand over operations

15. Exclusions / Not Included

- Third-party API keys are not transferred; the acquirer provisions its own accounts (FMP, Finnhub, ElevenLabs, Deepgram, Anthropic, AWS, LiveKit, OpenBB). This is standard and avoids key-abuse liability.
- No customer / user data is represented as included (the platform is pre-revenue with minimal user base).
- No revenue or traffic representations are made.
- Proprietary algorithm internals, agent prompts, scoring formulas, and all patent-pending implementation detail are disclosed only during due diligence under a signed NDA. Disclosure under NDA is confidential and does not constitute public disclosure.

16. Buyer's Due-Diligence Checklist

- ☐ Live site walk-through (neuralquant.co) — all flagship flows demonstrated live
- ☐ Smoke test suite execution (13/13 passing)
- ☐ Backtest reproduction (baseline stored in Supabase)
- ☐ Patent filing status, search report, and invention disclosure (under NDA)
- ☐ Service-by-service infra review (under NDA)

- ☐ Security audit documentation (RLS, IDOR, CSP, audit log)
- ☐ Code structure review (under NDA)
- ☐ Methodology page (public, no NDA needed)

17. Why The Price Is Fair

- 1. You are buying time. 6–12 months of build calendar and the data/voice integration scars that go with it.
- 2. You are buying working IP. A unique scoring methodology and an adversarial multi-agent design that no competitor currently ships, plus a pending patent.
- 3. You are buying a de-risked live system, not a bet on whether it can be built.
- 4. The ask is below US rebuild cost plus the live/IP premium. Even at ₹3 Cr, the acquirer pays less than recreating it would cost in senior labor plus the de-risked premium.
- 5. Strategic upside is large. For a brokerage, fund, or fintech, the voice + IRS% + adversarial-trust combination is a differentiated feature that would take a competitor a full cycle to copy — and the patent raises that cost further.

18. Next Steps

- Sign a mutual NDA. No source code, architecture detail, patent specifics, or live-internals demonstration is shared before the NDA is executed.
- Live product demonstration (remote, ~45 minutes).
- Letter of intent → full source and infra access for due diligence.
- Knowledge-transfer period post-close.
